Meeting Notes

- App

○ Two Interfaces – Caregiver and User

▪ Caretaker

- Inputs medication information, dosage, instructions, and scheduled times.
- Can add a photo of the medication bottle and/or pill for visual identification.
- Can change medication information and schedules.
- Can record personalized audio messages that play with medication reminders.
- Receives a notification if the user does not complete medication verification.
- Can view today's medication status:
 - Taken
 - Upcoming
 - Missed/Unconfirmed
- Can view medication history.
- Can contact the user directly through the app.
- Can view the user's location if location sharing has been enabled.
- Can receive optional safety/location notifications.
- Can manage which caregivers/family members have access to the account.

▪ Dependent

- Home screen prominently displays the next medication that needs to be taken.
- Displays:
 - Medication name
 - Picture of bottle/pill
 - Dosage
 - Time
 - Basic instructions
- Receives a visual and audio notification when it is time to take medication.
- Can hear personalized recorded messages from caregiver/family

- Can select:
 - Take Medication
 - Remind Me Later
 - I Need Help
- Scans the medication bottle before taking it to help verify that it is the correct medication.
- After taking medication, user completes a simple confirmation that it was taken.
- Medication is then marked TAKEN with the time it was confirmed.
- User can view today's medication schedule to see what has already been taken.
- If either required verification step is not completed, the app continues reminding the user and can eventually notify the caregiver.
- Provides an easily accessible Help option if the user is confused or unsure whether medication was already taken.
- Medication Verification
 - **Verification 1 — Before taking:** Scan medication bottle to verify the correct medication.
 - App compares the scanned medication with the medication scheduled for that time.
 - If incorrect, the app clearly tells the user **not to proceed** and shows the correct medication.
 - **Verification 2 — After taking:** User confirms that the medication was taken.
 - Only after confirmation is the dose recorded as **Taken**.
 - If either verification is incomplete, medication remains **Unconfirmed** rather than automatically being recorded as taken.
- GPS/Location Sharing
 - Optional location-sharing feature similar to Find My.
 - User chooses whether location is shared and which approved caregivers can access it.
 - Caregiver has a **Location** tab containing a map.
 - Displays:
 - Current or last known location
 - Time location was last updated

- Device battery level, if available
 - Optional notifications for arriving at or leaving predefined locations.
 - Location sharing can be turned on/off by the user.
 - Clearly shows the user when location sharing is active.
 - GPS is intended as a safety/support feature rather than being required for medication management.
 - Accessibility/Comfort
 - Large buttons and text.
 - Simple language.
 - High contrast.
 - Medication pictures alongside medication names.
 - Audio instructions.
 - Minimal menus/navigation.
 - Consistent button placement.
 - Important actions should not rely on color alone.
 - Familiar caregiver/family voices can make reminders feel more personal and recognizable.
 - User maintains as much control and independence as possible.
 - Caregiver is primarily alerted when assistance may actually be necessary.
- Implant
- Vibrates in correlating with phone ringing the phone plays a recording telling them what medication to take and how much the vibration doesn't stop till it detects the motion of taking pills and has confirmation from the user verbally telling the phone that the user has taken the medication. Tracker GPS
 - Possibly on skull for bone connectivity vibration to sound
 - Family member recording = comfort
- Wearable sleeve (sound plays sound of medication directions family member recording)
- App connection (dr, caretaker, impaired person)
 - Device in sleeve
- Alexa ish device

- Talk to alexa what medication confirms taken meds
 - Family connected to alexa texts family if not confirmed
 - Family can track?
- Weight display medication calls if med not taken
- **Smart Medication Station / Dock**
 - A physical station that stays in one permanent location in the home
 - Lights up and speaks when it is time for medication
 - Only unlocks or presents the correct medication/dose at the correct time
 - Uses a weight sensor, lid sensor, or camera to detect whether the medication was actually removed
 - If it is not completed after several prompts, it alerts a caregiver
 - Could play a prerecorded message from a family member for familiarity/comfort

Questions/Thoughts (Meeting Notes)

- Stakeholders need to be clearer.
- Accessibility is incredibly important.
- Think of tangible ways of how (our topic) works or how to measure.
